

Gosa Girma

Full-Stack Web Developer (MERN & TypeScript)

 gosagirma441@gmail.com  Adama, Ethiopia  gosagirma.me  github.com/gosag
 www.linkedin.com/in/gosa-girma

ABOUT

I build real-time, AI-integrated web apps end-to-end — from Socket.io  collaboration layers to Gemini-powered study tools — and ship them to production. Three live products, actively maintained. Seeking a full-stack role where I can contribute to building high-quality products using TypeScript while taking ownership of meaningful features. Open to remote.

MAIN PROJECTS

Shiplt — Real-Time Kanban Collaboration Platform , Full-stack developer

Real-time Kanban Web Application deployed on Vercel and Render. Live Demo: shipit.gosagirma.me  and GitHub: <https://github.com/gosag/Shiplt.git> 

- Architected real-time collaboration using Socket.io  (presence, live updates, notifications) on a full-stack React/TypeScript/Node.js/MongoDB app — enabling multiple users to work simultaneously without page refreshes.
- Built drag-and-drop kanban with dnd-kit and optimistic UI updates, eliminating the perceived latency that makes most kanban tools feel sluggish.
- Designed a scalable per-user read/unread system for comments (separate CommentRead model + upsert patterns), enabling real-time notification accuracy without full document rewrites.
- Designed and built workspace management with role-based access control, join request flows, and real-time notifications.
- Stress-tested with 4 concurrent users — cards, presence indicators, and notifications updated seamlessly in real time across all sessions with no conflicts or data loss.

EchoStudy — AI-Powered Study Hub , Full-Stack Developer

Type-Safe MERN Stack Web Application deployed on Vercel and Render. Live Demo: echostudy.gosagirma.me  and GitHub Repo: https://github.com/gosag/Gosa-s_StudyAi.git 

- Architected and launched a full-stack learning platform using React, Node.js, and TypeScript, focusing on responsive design and secure user authentication.
- Integrated the Google Gemini AI API to automatically generate dynamic quizzes and study summaries directly from user text inputs, **reducing manual preparation time for students by roughly 80%**.
- Designed scalable, type-safe RESTful APIs leveraging Zod for strict runtime schema validation, drastically decreasing frontend-backend data mismatch errors.
- Implemented robust backend architecture including spaced-repetition logic to handle complex learning workflows.
- Validated backend API correctness with Jest unit tests, covering edge cases in spaced-repetition logic and schema validation.

WatchVault — Cinematic Discovery Platform , Frontend Developer

Highly responsive movie discovery Web Application deployed on Vercel. Live Demo: watchvault.gosagirma.me  and GitHub: <https://github.com/gosag/movie-project.git> 

- Engineered a performant movie discovery interface utilizing React and CSS to fetch and render thousands of media records via the TMDB third-party API.
- Designed a mobile-first, highly responsive user interface with Framer Motion animations to deliver a seamless and engaging user experience across all device sizes.
- Optimized application rendering and search query performance through dynamic routing and intelligent state management.

LANGUAGES

TypeScript • JavaScript (ES6+) • Socket.io • HTML5 • CSS3

FRONTEND

React.js • Tailwind CSS • Shadcn/UI • Framer Motion • Responsive Design

BACKEND

Node.js • Express.js • MongoDB • RESTful APIs • Zod (Schema Validation)

TESTING & TOOLS

Git • GitHub • Jest • Vercel • Render • Postman
